

PerGroup#

<https://pytorch.org/docs/stable/generated/torch.ao.quantization.observer.PerGroup.html>

Description:

Represents per-channel group granularity in quantization. This granularity type calculates different quantization parameters for each group of elements. For example if the input tensor is shape [8, 16], and the group size is 4, then the input tensor is reshaped to [64, 4] quantization parameters are calculated for each group of 4 elements, giving a total of 64 quantization parameters. `group_size` (int) – The size of each quantization group

Function Signature

```
class torch.ao.quantization.observer.PerGroup(group_size)
[source]#
```

Detailed Documentation

Documentation

Represents per-channel group granularity in quantization.

This granularity type calculates different quantization parameters for each group of `<group_size>` elements.

For example if the input tensor is shape `[8, 16]`, and the group size is 4, then the input tensor is reshaped to `[64, 4]` quantization parameters are calculated for each group of 4 elements, giving a total of 64 quantization parameters.

`group_size` (int) – The size of each quantization group

Represents per-channel group granularity in quantization.

This granularity type calculates different quantization parameters for each group of `<group_size>` elements.

For example if the input tensor is shape `[8, 16]`, and the group size is 4, then the input tensor is reshaped to `[64, 4]` quantization parameters are calculated for each group of 4 elements, giving a total of 64 quantization parameters.

`group_size` (int) – The size of each quantization group
