

propagate_qconfig#

https://pytorch.org/docs/stable/generated/torch.ao.quantization.propagate_qconfig.html

Description:

Propagate qconfig through the module hierarchy and assign qconfig attribute on each leaf module module – input module qconfig_dict – dictionary that maps from name or type of submodule to quantization configuration, qconfig applies to all submodules of a given module unless qconfig for the submodules are specified (when the submodule already has qconfig attribute) prepare_custom_config_dict – dictionary for custom handling of modules see docs for prepare_fx() None, module is modified inplace with qconfig attached

Function Signature

```
class torch.ao.quantization.propagate_qconfig(module,  
qconfig_dict=None, prepare_custom_config_dict=None)[source]#
```

Parameters

Returns

Returns:

None, module is modified inplace with qconfig attached

Detailed Documentation

Documentation

Propagate qconfig through the module hierarchy and assign qconfig attribute on each leaf module

module – input module

qconfig_dict – dictionary that maps from name or type of submodule to quantization configuration, qconfig applies to all submodules of a given module unless qconfig for the submodules are specified (when the submodule already has qconfig attribute)

prepare_custom_config_dict – dictionary for custom handling of modules see docs for prepare_fx()

None, module is modified inplace with qconfig attached
