

torch.conj_physical#

https://pytorch.org/docs/stable/generated/torch.conj_physical.html

Description:

Computes the element-wise conjugate of the given input tensor. If input has a non-complex dtype, this function just returns input. This performs the conjugate operation regardless of the fact conjugate bit is set or not. In the future, `torch.conj_physical()` may return a non-writeable view for an input of non-complex dtype. It's recommended that programs not modify the tensor returned by `torch.conj_physical()` when input is of non-complex dtype to be compatible with this change.

Function Signature

```
torch.conj_physical(input, *, out=None) → Tensor#
```

Parameters

Keyword Arguments

Parameters

Keyword

out (Tensor, optional) – the output tensor.

Code Examples

```
>>> torch.conj_physical(torch.tensor([-1 + 1j, -2 + 2j, 3 - 3j]))  
tensor([-1 - 1j, -2 - 2j, 3 + 3j])
```

Notes & Warnings

NOTE This performs the conjugate operation regardless of the fact conjugate bit is set or not.

⚠ WARNING In the future, `torch.conj_physical()` may return a non-writeable view for an input of non-complex dtype. It's recommended that programs not modify the tensor returned by `torch.conj_physical()` when input is of non-complex dtype to be compatible with this change.

Detailed Documentation

Documentation

Computes the element-wise conjugate of the given input tensor. If input has a non-complex dtype, this function just returns input.

This performs the conjugate operation regardless of the fact conjugate bit is set or not.

In the future, `torch.conj_physical()` may return a non-writeable view for an input of non-complex dtype. It's recommended that programs not modify the tensor returned by `torch.conj_physical()` when input is of non-complex dtype to be compatible with this change.

`input` (Tensor) – the input tensor.

`out` (Tensor, optional) – the output tensor.
