

torch.floor_divide#

https://pytorch.org/docs/stable/generated/torch.floor_divide.html#torch.floor_divide

Description:

Before PyTorch 1.13 `torch.floor_divide()` incorrectly performed truncation division. To restore the previous behavior use `torch.div()` with `rounding_mode='trunc'`. Computes input divided by other, elementwise, and floors the result. Supports broadcasting to a common shape, type promotion, and integer and float inputs. input (Tensor or Number) – the dividend

Function Signature

```
torch.floor_divide(input, other, *, out=None) → Tensor#
```

Parameters

Keyword Arguments

Parameters

Keyword

out (Tensor, optional) – the output tensor.

Code Examples

```
>>> a = torch.tensor([4.0, 3.0])
>>> b = torch.tensor([2.0, 2.0])
>>> torch.floor_divide(a, b)
tensor([2.0, 1.0])
>>> torch.floor_divide(a, 1.4)
tensor([2.0, 2.0])
```

Notes & Warnings

NOTE Before PyTorch 1.13 `torch.floor_divide()` incorrectly performed truncation division. To restore the previous behavior use `torch.div()` with `rounding_mode='trunc'`.

Detailed Documentation

Documentation

Before PyTorch 1.13 `torch.floor_divide()` incorrectly performed truncation division. To restore the previous behavior use `torch.div()` with `rounding_mode='trunc'`.

Computes input divided by other, elementwise, and floors the result.

Supports broadcasting to a common shape, type promotion, and integer and float inputs.

input (Tensor or Number) – the dividend

other (Tensor or Number) – the divisor

out (Tensor, optional) – the output tensor.

Before PyTorch 1.13 `torch.floor_divide()` incorrectly performed truncation division. To restore the previous behavior use `torch.div()` with `rounding_mode='trunc'`.

Computes input divided by other, elementwise, and floors the result.

Supports broadcasting to a common shape, type promotion, and integer and float inputs.
