

DimConstraints#

https://pytorch.org/docs/stable/generated/torch.fx.experimental.symbolic_shapes

Description:

Custom solver for a system of constraints on symbolic dimensions. Solutions are “static” values or simplified “dynamic” constraints. Add an expression to the set of constraints. Return whether the expression is a trivial constraint (i.e., an obvious tautology). Add an equality constraint

Function Signature

```
class
torch.fx.experimental.symbolic_shapes.DimConstraints(symbol_
to_source, var_to_val, marked_dynamic,
source_name_to_debug_name)[source]#
add(expr)[source]#
Return type
add_equality(source, expr)[source]#
forced_specializations()[source]#
```

Returns:

`_SympyT`

Detailed Documentation

Documentation

Custom solver for a system of constraints on symbolic dimensions. Solutions are “static” values or simplified “dynamic” constraints.

Add an expression to the set of constraints.

Return whether the expression is a trivial constraint (i.e., an obvious tautology).

Add an equality constraint

Returns a dictionary of the names of symbols to their specialized value

`dict[str, sympy.core.expr.Expr]`

Format a message for constraint violation errors

Eliminate expressions of the form $b // d$ and $b \% d$ while adding congruences of the form $b \% d == k$. This leaves rational operators (in particular of the form b / d) that our inequality solver can handle. We solve the added congruences separately (using our congruence solver, see below).

Solve the system of constraint equations to find simplified constraints
