

# StrictMinMaxConstraint#

[https://pytorch.org/docs/stable/generated/torch.fx.experimental.symbolic\\_shapes.StrictMinMaxConstraint.html](https://pytorch.org/docs/stable/generated/torch.fx.experimental.symbolic_shapes.StrictMinMaxConstraint.html)

## Description:

For clients: the size at this dimension must be within 'vr' (which specifies a lower and upper bound, inclusive-inclusive) AND it must be non-negative and should not be 0 or 1 (but see NB below). For backends: there must not be any guards on this dimension which are not implied by the given lower and upper bound. Regardless of the lower bound, the backend can assume the size is non-negative and that it is not 0 or 1. An unbounded StrictMinMaxConstraint can be thought of as a strict version of "RelaxedUnspecConstraint". NB: Export will often unsoundly assume that a graph works for 0/1, even though at trace time we assumed size is not 0 or 1. The idea is that if we produce a graph that works for a range of values, it will be OK for N=0/1 too. Format the constrain equation

## Function Signature

---

```
class
torch.fx.experimental.symbolic_shapes.StrictMinMaxConstraint
(warn_only, vr)[source]#
render(source)[source]#
Return type
```

### Returns:

str

# Detailed Documentation

## Documentation

For clients: the size at this dimension must be within 'vr' (which specifies a lower and upper bound, inclusive-inclusive) AND it must be non-negative and should not be 0 or 1 (but see NB below).

For backends: there must not be any guards on this dimension which are not implied by the given lower and upper bound. Regardless of the lower bound, the backend can assume the size is non-negative and that it is not 0 or 1.

An unbounded `StrictMinMaxConstraint` can be thought of as a strict version of "RelaxedUnspecConstraint".

NB: Export will often unsoundly assume that a graph works for 0/1, even though at trace time we assumed size is not 0 or 1. The idea is that if we produce a graph that works for a range of values, it will be OK for  $N=0/1$  too.

Format the constrain equation
