

torch.gcd#

<https://pytorch.org/docs/stable/generated/torch.gcd.html#torch.gcd>

Description:

Computes the element-wise greatest common divisor (GCD) of input and other. Both input and other must have integer types. This defines $\text{gcd}(0,0)=0$. input (Tensor) – the input tensor.

Function Signature

```
torch.gcd(input, other, *, out=None) → Tensor#
```

Parameters

Keyword Arguments

Parameters

Keyword

out (Tensor, optional) – the output tensor.

Code Examples

```
>>> a = torch.tensor([5, 10, 15])
>>> b = torch.tensor([3, 4, 5])
>>> torch.gcd(a, b)
tensor([1, 2, 5])
>>> c = torch.tensor([3])
>>> torch.gcd(a, c)
tensor([1, 1, 3])
```

Notes & Warnings

NOTE

Note This defines $\text{gcd}(0,0)=0$

Detailed Documentation

Documentation

Computes the element-wise greatest common divisor (GCD) of input and other.

Both input and other must have integer types.

This defines $\text{gcd}(0,0)=0$ $\text{gcd}(0, 0) = 0$ $\text{gcd}(0,0)=0$.

input (Tensor) – the input tensor.

other (Tensor) – the second input tensor

out (Tensor, optional) – the output tensor.

Computes the element-wise greatest common divisor (GCD) of input and other.

Both input and other must have integer types.

This defines $\text{gcd}(0,0)=0$ $\text{gcd}(0, 0) = 0$ $\text{gcd}(0,0)=0$.

input (Tensor) – the input tensor.

input (Tensor) – the input tensor.

other (Tensor) – the second input tensor

other (Tensor) – the second input tensor

out (Tensor, optional) – the output tensor.
