

torch.mps.set_per_process_memory_fraction

https://pytorch.org/docs/stable/generated/torch.mps.set_per_process_memory_fraction.html

Description:

Set memory fraction for limiting process's memory allocation on MPS device. The allowed value equals the fraction multiplied by recommended maximum device memory (obtained from Metal API `device.recommendedMaxWorkingSetSize`). If trying to allocate more than the allowed value in a process, it will raise an out of memory error in allocator. `fraction` (float) – Range: 0~2. Allowed memory equals `total_memory * fraction`. Passing 0 to `fraction` means unlimited allocations (may cause system failure if out of memory). Passing `fraction` greater than 1.0 allows limits beyond the value returned from `device.recommendedMaxWorkingSetSize`.

Function Signature

```
torch.mps.set_per_process_memory_fraction(fraction)[source]#
```

Parameters

Notes & Warnings

NOTE

Note Passing 0 to fraction means unlimited allocations (may cause system failure if out of memory). Passing fraction greater than 1.0 allows limits beyond the value returned from `device.recommendedMaxWorkingSetSize`.

Detailed Documentation

Documentation

Set memory fraction for limiting process's memory allocation on MPS device. The allowed value equals the fraction multiplied by recommended maximum device memory (obtained from Metal API `device.recommendedMaxWorkingSetSize`). If trying to allocate more than the allowed value in a process, it will raise an out of memory error in allocator.

fraction (float) – Range: 0~2. Allowed memory equals `total_memory * fraction`.

Passing 0 to fraction means unlimited allocations (may cause system failure if out of memory). Passing fraction greater than 1.0 allows limits beyond the value returned from `device.recommendedMaxWorkingSetSize`.
