

torch.mv#

<https://pytorch.org/docs/stable/generated/torch.mv.html>

Description:

Performs a matrix-vector product of the matrix input and the vector vec.

If input is a $(n \times m)$ tensor, vec is a 1-D tensor of size m , out will be 1-D of size n . This function does not broadcast. input (Tensor) – matrix to be multiplied

Function Signature

```
torch.mv(input, vec, *, out=None) → Tensor#
```

Parameters

Keyword Arguments

Parameters

Keyword

out (Tensor, optional) – the output tensor.

Code Examples

```
>>> mat = torch.randn(2, 3)
>>> vec = torch.randn(3)
>>> torch.mv(mat, vec)
tensor([ 1.0404, -0.6361])
```

Notes & Warnings

NOTE: This function does not broadcast.

Detailed Documentation

Documentation

Performs a matrix-vector product of the matrix input and the vector vec.

If input is a $(n \times m)(n \times m)(n \times m)$ tensor, vec is a 1-D tensor of size m , out will be 1-D of size n .

This function does not broadcast.

input (Tensor) – matrix to be multiplied

vec (Tensor) – vector to be multiplied

out (Tensor, optional) – the output tensor.

Performs a matrix-vector product of the matrix input and the vector vec.

If input is a $(n \times m)(n \times m)(n \times m)$ tensor, vec is a 1-D tensor of size m , out will be 1-D of size n .

This function does not broadcast.

input (Tensor) – matrix to be multiplied

input (Tensor) – matrix to be multiplied

vec (Tensor) – vector to be multiplied

vec (Tensor) – vector to be multiplied

out (Tensor, optional) – the output tensor.
