

torch.poisson#

<https://pytorch.org/docs/stable/generated/torch.poisson.html#torch.poisson>

Description:

Returns a tensor of the same size as input with each element sampled from a Poisson distribution with rate parameter given by the corresponding element in input i.e., input must be non-negative. input (Tensor) – the input tensor containing the rates of the Poisson distribution generator (torch.Generator, optional) – a pseudorandom number generator for sampling

Function Signature

```
torch.poisson(input, generator=None) → Tensor#
```

Parameters

Keyword Arguments

Parameters

Keyword

generator (torch.Generator, optional) – a pseudorandom number generator for sampling

Code Examples

```
>>> rates = torch.rand(4, 4) * 5 # rate parameter between 0 and 5
>>> torch.poisson(rates)
tensor([[9., 1., 3., 5.],
        [8., 6., 6., 0.],
        [0., 4., 5., 3.],
        [2., 1., 4., 2.]])
```

Detailed Documentation

Documentation

Returns a tensor of the same size as input with each element sampled from a Poisson distribution with rate parameter given by the corresponding element in input i.e.,

input must be non-negative.

input (Tensor) – the input tensor containing the rates of the Poisson distribution

generator (torch.Generator, optional) – a pseudorandom number generator for sampling

Returns a tensor of the same size as input with each element sampled from a Poisson distribution with rate parameter given by the corresponding element in input i.e.,

input must be non-negative.

input (Tensor) – the input tensor containing the rates of the Poisson distribution

generator (torch.Generator, optional) – a pseudorandom number generator for sampling
