

torch.select#

<https://pytorch.org/docs/stable/generated/torch.select.html>

Description:

Slices the input tensor along the selected dimension at the given index. This function returns a view of the original tensor with the given dimension removed. If input is a sparse tensor and returning a view of the tensor is not possible, a `RuntimeError` exception is raised. In this is the case, consider using `torch.select_copy()` function. input (Tensor) – the input tensor. dim (int) – the dimension to slice

Function Signature

```
torch.select(input, dim, index) → Tensor#
```

Parameters

Notes & Warnings

NOTE

Note If input is a sparse tensor and returning a view of the tensor is not possible, a `RuntimeError` exception is raised. In this is the case, consider using `torch.select_copy()` function.

NOTE

Note `select()` is equivalent to slicing. For example, `tensor.select(0, index)` is equivalent to `tensor[index]` and `tensor.select(2, index)` is equivalent to `tensor[:, :, index]`.

Detailed Documentation

Documentation

Slices the input tensor along the selected dimension at the given index. This function returns a view of the original tensor with the given dimension removed.

If input is a sparse tensor and returning a view of the tensor is not possible, a `RuntimeError` exception is raised. In this is the case, consider using `torch.select_copy()` function.

`input (Tensor)` – the input tensor.

`dim (int)` – the dimension to slice

`index (int)` – the index to select with

`select()` is equivalent to slicing. For example, `tensor.select(0, index)` is equivalent to `tensor[index]` and `tensor.select(2, index)` is equivalent to `tensor[:, :, index]`.
