

torch.set_printoptions#

https://pytorch.org/docs/stable/generated/torch.set_printoptions.html#torch.set_printoptions

Description:

Set options for printing. Items shamelessly taken from NumPy precision – Number of digits of precision for floating point output (default = 4). threshold – Total number of array elements which trigger summarization rather than full repr (default = 1000). edgeitems – Number of array items in summary at beginning and end of each dimension (default = 3). linewidth – The number of characters per line for the purpose of inserting line breaks (default = 80). Thresholded matrices will ignore this parameter.

Function Signature

```
torch.set_printoptions(precision=None, threshold=None,
edgeitems=None, linewidth=None, profile=None, sci_mode=None)
[source]#
```

Parameters

Code Examples

```
>>> # Limit the precision of elements
>>> torch.set_printoptions(precision=2)
>>> torch.tensor([1.12345])
tensor([1.12])
>>> # Limit the number of elements shown
>>> torch.set_printoptions(threshold=5)
>>> torch.arange(10)
tensor([0, 1, 2, ..., 7, 8, 9])
>>> # Restore defaults
>>> torch.set_printoptions(profile='default')
>>> torch.tensor([1.12345])
tensor([1.1235])
>>> torch.arange(10)
tensor([0, 1, 2, 3, 4, 5, 6, 7, 8, 9])
```

Detailed Documentation

Documentation

Set options for printing. Items shamelessly taken from NumPy

`precision` – Number of digits of precision for floating point output (default = 4).

`threshold` – Total number of array elements which trigger summarization rather than full repr (default = 1000).

`edgeitems` – Number of array items in summary at beginning and end of each dimension (default = 3).

`linewidth` – The number of characters per line for the purpose of inserting line breaks (default = 80). Thresholded matrices will ignore this parameter.

`profile` – Sane defaults for pretty printing. Can override with any of the above options. (any one of default, short, full)

`sci_mode` – Enable (True) or disable (False) scientific notation. If None (default) is specified, the value is defined by `torch._tensor_str._Formatter`. This value is automatically chosen by the framework.
