

torch.sparse.spsolve#

<https://pytorch.org/docs/stable/generated/torch.sparse.spsolve.html>

Description:

Computes the solution of a square system of linear equations with a unique solution. Its purpose is similar to `torch.linalg.solve()`, except that the system is defined by a sparse CSR matrix with layout `sparse_csr`.
input (Tensor) – a sparse CSR matrix of shape (n, n) representing the coefficients of the linear system. other (Tensor) – a dense matrix of shape (n,) representing the right-hand side of the linear system. left (bool, optional) – whether to solve the system for input @ out = other (default) or out @ input = other. Only left=True is supported.

Function Signature

```
torch.sparse.spsolve(input, other, *, left=True) → Tensor#
```

Parameters

Detailed Documentation

Documentation

Computes the solution of a square system of linear equations with a unique solution. Its purpose is similar to `torch.linalg.solve()`, except that the system is defined by a sparse CSR matrix with layout `sparse_csr`.

`input` (Tensor) – a sparse CSR matrix of shape (n, n) representing the coefficients of the linear system.

`other` (Tensor) – a dense matrix of shape $(n,)$ representing the right-hand side of the linear system.

`left` (bool, optional) – whether to solve the system for `input @ out = other` (default) or `out @ input = other`. Only `left=True` is supported.
