

device_of#

https://pytorch.org/docs/stable/generated/torch.xpu.device_of.html

Description:

Context-manager that changes the current device to that of given object. You can use both tensors and storages as arguments. If a given object is not allocated on a XPU, this is a no-op. obj (Tensor or Storage) – object allocated on the selected device.

Function Signature

```
class torch.xpu.device_of(obj)[source]#
```

Parameters

Detailed Documentation

Documentation

Context-manager that changes the current device to that of given object.

You can use both tensors and storages as arguments. If a given object is not allocated on a XPU, this is a no-op.

obj (Tensor or Storage) – object allocated on the selected device.

Context-manager that changes the current device to that of given object.

You can use both tensors and storages as arguments. If a given object is not allocated on a XPU, this is a no-op.
